ProfitShield

Good food.
Stronger margins.

Restaurant financial intelligence.

From scattered records to an evidence-backed next move.

IMPORT → EXPLAIN → SIMULATE → REVIEW

Five reports. One unanswered question.

“What did I actually keep—and what needs my attention?”

Delivery payouts

Fees, promotions, refunds

POS sales

A different view of revenue

Supplier invoices

Prices, quantities, document copies

The back-house challenge: less manual stitching.
Clearer decisions from records owners already have.

One workspace. A decision you can inspect.

A guided journey from imported records to a reviewed next move.

01 Bring the records

Synthetic CSV + known platform exports

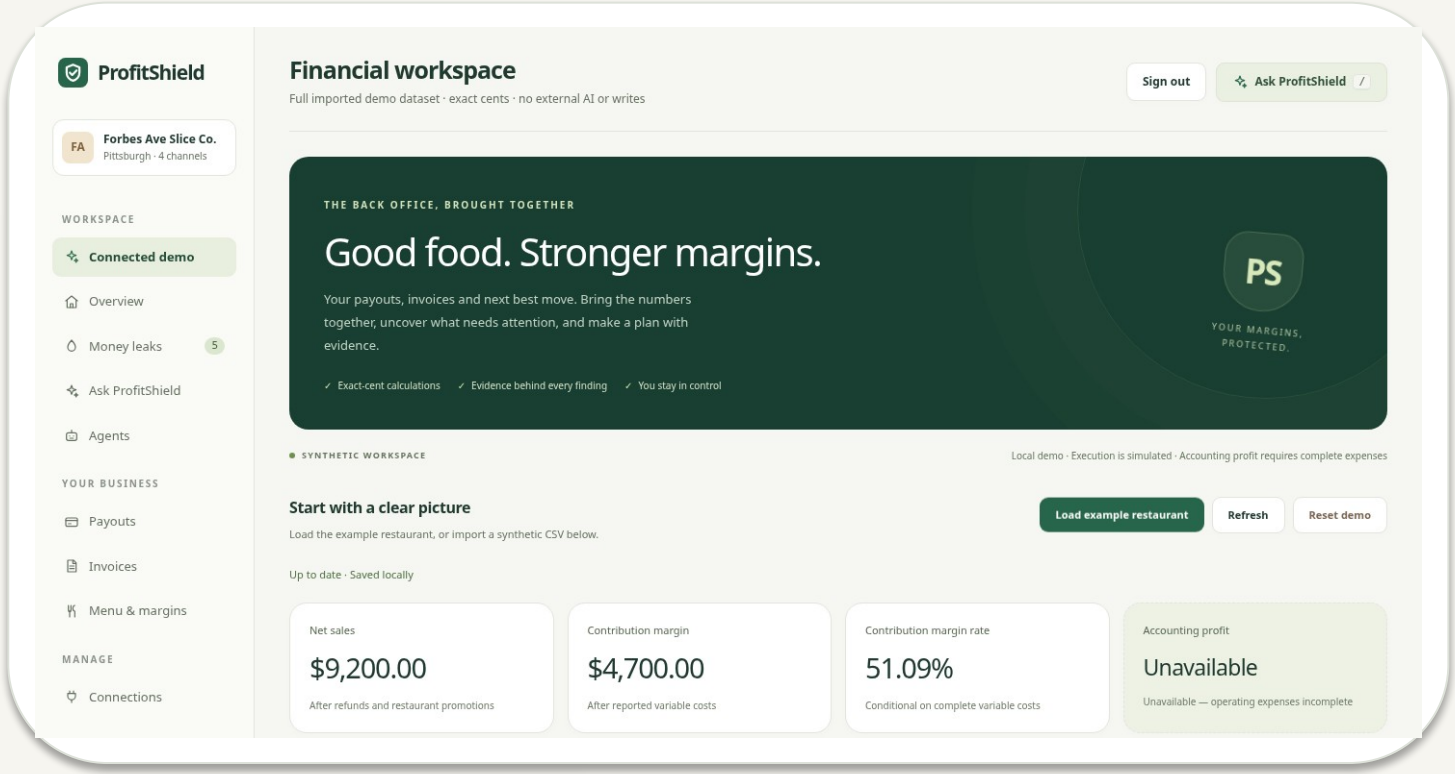

02 Follow the evidence

Auditor finding → exact source row

03 Compare the tradeoff

Scenario → assumptions → approval

LIVE DEMO · localhost:8000/#demo

Start with a number you can defend.

Synthetic reference dataset · exact cents · all figures from the backend

GROSS SALES

$10,000

Before refunds and restaurant promotions

NET SALES

$9,200

After $300 refunds and $500 merchant promotions

CONTRIBUTION MARGIN

$4,700

After $1,500 commissions, $2,800 food, $200 other variable costs

51.09% margin rate · Accounting profit unavailable: operating expenses are incomplete.

A $100 question. With the receipts.

Example: DoorDash:G-DD · supplied contract terms, not independently verified

CHARGED COMMISSION

$900

Recorded against $4,000 gross sales

EXPECTED AT SUPPLIED 20%

$800

20% × $4,000, rounded per transaction

CONDITIONAL EXPOSURE

$100

Review contract + payout before claiming

A duplicate invoice is a second document—not proof of a second payment.

What if menu prices increased by 5%?

A conditional comparison on the same synthetic baseline—not a demand forecast.

BEFORE

$4,700.00

SCENARIO

$5,127.50

+$427.50 contribution margin, if the assumptions hold.

Same demand & quantities · Refunds/promotions fixed in dollars · No platform price changed

Interpretation. Arithmetic. Approval.

Three jobs, with clear boundaries.

INTERPRET

Explain the records

Optional AI assists mapping, receipt reading and Q&A in the historical path.

CALCULATE

Code owns the math

Python Decimal + integer cents. One baseline feeds findings and scenarios.

DECIDE

The owner approves

Review the evidence and assumptions. Exact confirmation before a simulated action.

This connected demo uses a labeled deterministic Guru fallback. External AI is privacy-gated.

See the leak.
Understand the tradeoff.
Own the decision.

Built for the restaurant owner behind the counter.
Aligned with DoorDash's back-house challenge.

ProfitShield / Good food. Stronger margins.

Two experiences. One financial core.

Use the connected workspace as the primary judge journey.

CONNECTED WORKSPACE

Normalized CSV → prototype.py
→ financial_engine.py → evidence / scenarios

HISTORICAL EXPLORER

CSV / POS / receipts → server.py
→ legacy_finance.py → financial_engine.py

SQLite persistence · Python standard-library HTTP server
Owner sessions + CSRF on the UI branch · Vanilla HTML / CSS / JavaScript

What we can demonstrate—and what comes next.

A working local prototype, with explicit limits.

WORKING LOCAL FLOW

CSV import + dedupe; evidence; exact-cent baseline; scenarios; saved drafts and state.

SIMULATED OR OPTIONAL

Connected execution is simulated. Guru is rule-based. External AI and Square sandbox are separate paths.

NEXT TO BUILD

Complete costs + payment reconciliation; tenant/location isolation; privacy-reviewed AI; owner pilots.

No production deployment, guaranteed recovery, causal forecast, or multi-location isolation is claimed.
